SonicWALL ProCurve collaborating to protect enterprise networks

SonicWALL and ProCurve Networking by HP are working together to provide interoperable security solutions for enterprises of all sizes. SonicWALL's SonicWALL® PRO series UTM appliance portfolio, along with the ProCurve network environment strengthen ProCurve's ProActive Defense strategy to defend networks against security threats.

SonicWALL is a recognized global leader in the small and medium business markets. Its solutions are deployed in distributed enterprise environments, government, retail point-of-sale and healthcare segments – as well as through service providers. A leader in the rapidly growing Unified Threat Management category, SonicWALL's UTM solution features high-performance, solid-state firewalls and VPN appliances with value-added security subscriptions. Those include anti-virus, intrusion prevention and anti-spyware for wired and wireless networks of all sizes.

The ProCurve Network Immunity Manager (NIM) is a security management tool that monitors wired and wireless networks for internal network threats, and allows administrators to set security policies for threat detection and dynamic response at the edge of the network. NIM can accept alerts directly from SonicWALL UTM appliances, and mitigate the threat at the edge of the network where the offender launched the attack. NIM and the the SonicWALL® PRO series UTM appliances work together to secure networks against internal and external threats. NIM can accept security alerts from SonicWALL's UTM appliances, and it can also remotely mirror suspect traffic identified by the NIM (Network Behavior Anomaly Detection) NBAD engines to a SonicWALL UTM for deeper inspection.

ProCurve and SonicWALL products have gone through formalized interoperability testing and certification that provides comprehensive, pre-qualified solutions for resellers and customers worldwide. The combination of SonicWALL's SonicWALL® PRO Series UTM appliances and ProCurve Network Immunity Manager further extends ProCurve's leadership position in enhancing the security of networks, and provides a unified network security architecture that allows customers to cost-effectively improve their overall security.
